

CARE AND MAINTENANCE INSTRUCTIONS

Concrete

Material Characteristics

Concrete artifacts are crafted using natural materials and a completely artisanal and ecological production cycle.

The concrete is manually mixed and poured into molds, then allowed to cure and finished on the surface. The result is a unique artisanal product, colored with natural oxides, where imperfections are synonymous with uniqueness and authenticity.

CARE AND MAINTENANCE INSTRUCTIONS

Concrete

To always keep the surface in the best condition, it is recommended to pay particular attention to the maintenance phases of the artifact.

Recommendations:

- Use a neutral pH detergent and a soft, non-abrasive cloth.
- Use soap dishes for soaps and clean spilled liquids with cold water and a soft cloth.
- It is recommended to keep corrosive liquids with high pH levels, such as bleach, lemon, or nail polish remover, away as they may cause stains and erosion on the surface.

Not recommended:

- Avoid leaving wet or damp products on the surface to prevent stains or marks.
- Do not use acidic products or abrasive sponges that may damage the finish.

CAUTION: Absolutely avoid detergents containing ammonia and/or solvents and ethyl alcohol, regardless of their concentration and even if diluted, as they can attack the material. Do not use excessively abrasive tools. Avoid rough and abrasive sponges, metallic scrubbers.

Despite concrete being a durable material, due to its vulnerability, cracking may occur, especially on the edges of the basin. Avoid collisions with heavy objects directly on the surface to protect your sink.
